

Energy storage battery box thermal simulation

Overview

This study employs the isothermal battery calorimetry (IBC) measurement method and computational fluid dynamics (CFD) simulation to develop a multi-domain thermal modeling framework for battery systems, spanning from individual cells to modules, clusters, and ultimately the container level. This study employs the isothermal battery calorimetry (IBC) measurement method and computational fluid dynamics (CFD) simulation to develop a multi-domain thermal modeling framework for battery systems, spanning from individual cells to modules, clusters, and ultimately the container level. To ensure that the maximum temperature (T_{max}) and maximum temperature difference (ΔT_{max}) remain within acceptable limits after high-rate discharge, this study proposes a novel air-cooled battery thermal management system (BTMS).
