Overview

In large battery assemblies, which are integrated, for example, in electric vehicles or stationary storage systems, up to several thousand single battery cells are connected together. Every single cell connection influe. Large battery assemblies are of particular interest both for the progressing electrification of mobility. As mentioned in Section 1, the electrical contact resistances of cell connections are of high relevance for the quality of a battery assembly. To obtain transferable results, the electrical con. The main characteristic of resistance spot welding is that only a small volume of the work pieces is melted and fused together. The welding heat is generated by the electrical power. Ultrasonic welding is a solid-state welding technique. The work pieces are not melted but pressed and scrubbed together,. Fig. 8 illustrates the functional principle of weldi. Laser beam welding uses the absorption of electromagnetic waves to heat up the joint partners. The laser beam can be provided by various laser sources. In this study, the laser source.
