

# How big an inverter should I use for six photovoltaic panels

## Overview

Most solar professionals recommend sizing your inverter for solar panels between 75% and 115% of your total panel wattage, with the sweet spot around 1:1. Undersizing means tripped breakers and failed startups. This guide walks through the sizing. This guide covers the complete inverter sizing methodology — DC:AC ratio, MPPT voltage windows, string sizing, and how to handle shading and future expansion. The DC:AC ratio (also called the inverter loading ratio or ILR) is the ratio of your solar array's DC capacity to your inverter's AC output. Your inverter size should match your solar array's capacity, not your electricity bill. This means your inverter doesn't need to power your entire home—it just converts whatever your panels generate. Getting the size right means the difference between 95% efficiency and 70% efficiency, which translates to hundreds of dollars in lost energy production every. Enter the system size (kW), peak load (kW), and desired headroom (%) to get the recommended inverter capacity. But do not oversize excessively.
