

# How much electricity can a 15mw energy storage system store

## Overview

A central issue in the low carbon future is large-scale energy storage. Due to the variability of renewable electricity (wind, solar) and its lack of synchronicity with the peaks of electricity demand, there is an essential need for energy storage. Intra-day storage requirements in the UK's nuclear and fossil-fuelled electricity system of 30 or more years ago, large scale nuclear and coal-fired thermal power stations provided a natural form of energy storage. Making the very rough assumption that the power available from renewable electricity will be constant through the day (which can be reasonably true for off-shore wind power); the amount of energy storage required is calculated above. The intra-day storage requirements calculated above do not account for the need to level-out inter-seasonal variations in power demand that occur on a 6-monthly cycle. The same amount of energy storage is required. There are many applications for electricity storage: from rechargeable batteries in small appliances to large hydroelectric dams, used for grid-scale electricity storage. They differ in their applications and costs.
