

New photovoltaic power plants and photovoltaic cells

Overview

Presently, the world is going through a euphoric rush to install photovoltaic (PV) devices in deserts, over water bodies, on rooftops of houses, vehicles, and parking spaces, and many other applications. The world is under siege by the imminent threat from global warming. Despite isolated efforts to combat climate change, the PV effect, i.e., the phenomenon in which the electrical potential is developed across the junction between two photoresponsive materials upon being irradiated with photons. Conventionally, commercial production of PV energy has been centered around crystalline silicon and thin-film technologies (e.g., Cadmium telluride (CdTe) and Copper Indium Gallium Selenide (CIGS)). The most commonly and widely referred parameter for comparing different PV technology is power conversion efficiency (PCE). It is of paramount importance. Several nations around the world have recognized the urgency of action needed to combat climate change and introduced policies and legislation to restrict global warming and climate change.
