

# Rooftop solar photovoltaic power generation measurement

## Overview

In this article, we will assess the power generation capacity of rooftop solar panels. We will explore essential aspects such as efficiency, configuration, and geographic influence. This information aims. The Roof-Solar-Max method successfully optimizes the placement of photovoltaic (PV) panels on urban rooftops, significantly increasing energy generation potential. The methodology demonstrated that PV energy generation in the urban district studied can exceed the local electricity demand by more. This paper presents an open-source dataset intended to enhance the analysis and optimization of photovoltaic (PV) power generation in urban environments, serving as a valuable resource for various applications in solar energy research and development. The dataset comprises measured PV power. Using ground-truth measurements of individual PV systems, available at an unprecedented temporal and spatial scale, we show that by estimating the PV power production of an individual rooftop system by combining solar irradiance and temperature data, the characteristics of the PV system inferred.
