

Solar control panel with terminals

Overview

There are two ways to control the power supply to a battery. Therefore, there are 2 types of charge controllers, namely pulse-width modulation and Maximum PowerPoint Tracking. A pulse-width modulation (PWM). The term MPPT stands for Maximum Power Point Tracker. It is an electronic DC-to-DC converter used to optimize the match between the solar panels and the battery bank, or the utility. A solar charge controller contains a Low Voltage Disconnect (LVD) that is usually used for smaller loads, including small appliances and lights. It is recommended to use the LVD output. There are multiple steps that need to be followed for the purpose, but the first one is to wear rubber gloves before touching anything. Step 1: Calculate the total operating current. Common features present in all good solar charge controllers are as follows:

1. The ability to set the voltage of the battery bank and the type of battery
2. Setting up the indicating lights
