

Solar inverter DC input resistance

Overview

This standard requires that the insulation resistance of the PV system shall not be less than $R_{iso} = (V_{max_PV} / 30 \text{ mA})$. Find the ideal DC input voltage (12V, 24V, or 48V) for your inverter setup based on load power, current limits, and efficiency to ensure optimal wiring and system safety. Formula used: $DC \text{ Current} = \text{Power} / (\text{Voltage} \times \text{Efficiency})$. The recommended system voltage is the lowest voltage where $\text{current} \leq$. The DC/AC ratio (also called the panel-to-inverter ratio) compares the total DC wattage of your solar panels to the AC wattage rating of your inverter. For example, if you have 4,000 W of panels and a 3,000 W inverter, the ratio is: $DC/AC \text{ ratio} = 4000 \div 3000 = 1.33$. 6V battery voltage, and 25C ambient, the maximum charge current is 88A. See manual, limitations section, for further details. DC rating: 4 A up to 35 VDC and 1 A up to 70.
