

# Solar photovoltaic panels are not connected to the grid for self-use

## Overview

Unlike conventional PV systems, which are connected to the public grid and can feed surplus electricity into it, an off-grid system is not connected to the grid. Ideal for remote areas, rural properties or those looking for total energy autonomy, the off-grid system guarantees. But what happens if PV modules, or solar panels, are disconnected when not in use?

Disconnection stops energy production, which means missing out on generating electricity that could be stored for later use. Hybrid systems combine grid connection with battery backup, giving you power during outages while still letting you draw. A standalone solar PV system is defined as a system that uses solar photovoltaic (PV) modules to generate electricity from sunlight without relying on the utility grid. It can power applications like lighting, water pumping, ventilation, communication, and entertainment in remote or off-grid.
