

The current that the nickel strip of lithium battery pack can withstand

Overview

Your nickel strip has to safely carry the current of the parallel group. That depends on: Examples of popular 18650/21700 cells: If you have 3 cells in parallel (3P) and each cell can do 20A, that group could see up to 60A. Your nickel has to be sized to handle the worst-case. When you're building or rebuilding lithium-ion battery packs, the nickel strip is not "just metal. If the strip is too thin or too narrow, you get: In this guide, we'll break down exactly what thickness and width of nickel strip you need. In this article, we will explain how to find the correct wire, fuse, and nickel strip for a battery-powered project. This creates the conductive pathway that allows. Properly sizing nickel strips for batteries is essential for ensuring both performance and safety. Think of this like a water pipe. When resistance is high, energy is. The largest cross sectional area on this chart is 12 mm wide and 0.15 mm thick, with optimal current carrying capacity of 17 A (from that table).
